Graduate Course – 2020-2021 First Semester

Today, we will learn about how to run a c program on a PC and also on Linux.

In order to run the C program, we need a compiler on Windows environment.

We can download Dev C++ compiler.

You can goto google search for Dev C++ (You will find the latest version of the C and C++ compiler. As of today, we can use ver 5.11)

Try to download the compiler and install on your notebook or Desktop windows environment.

To write your program in a text file, try to open “Notepad” or “記事本”

Let us start writing a simple “Hello world” program in C.

The first hello world program is as follows:

```
#include <stdio.h>
main()
{
printf("Hello World\n");
}
```

Program to Print an Integer

```
#include <stdio.h>
int main()
{
    int number;
    print("Enter a number: ");
    // reads and stores input
    scanf("%d",&number);
    //displays output here
    printf(" You entered  %d",number);
    return 0;
}
```

There are many examples given on the webpage and try to learn from the webpage.

`https://www.programiz.com/c-programming/examples`

There are about 71 examples to run. Try to run each of the examples and see how it is written.
